

CARBON STEEL GLOBE VALVE WITH BELLOW PN40 ICP DIN 3202-1 F1

Carbon steel globe valve with bellow flanged PN40 for no corrosive fluids, steam, hydrocarbons and thermic fluid.
Stainless steel bellow and stainless steel + graphite gasket.
Anti-turn device to avoid the risk of torsion of bellows.
Pressure equalizing plug in DN200
Bolted bonnet and packing for an easy maintenance.
Compatible with explosive atmosphere, ATEX Zone 1&21 and Zone 2&22.

Size : DN15 to DN200
Connection : Flanged PN40 RF
Min Temperature : -29°C
Max Temperature : +400°C
Max Pressure : 40 bars
Specifications : Non rising stem
Stainless steel bellow
Bolted bonnet and packing

Materials : Carbon steel EN 1.0619

CARBON STEEL GLOBE VALVE WITH BELLOW PN40 ICP DIN 3202-1 F1

SPECIFICATIONS :

- Respect the flow direction indicated by the arrow
- Non rising stem
- Bolted bonnet and gland pack
- Stainless steel bellow
- Pressure equalizing plug in DN200
- Pressed seat in the body
- Anti-turn device to avoid the risk of torsion of bellows
- Flanges R.F. PN40
- RAL 5002 blue painting, 40μ thickness

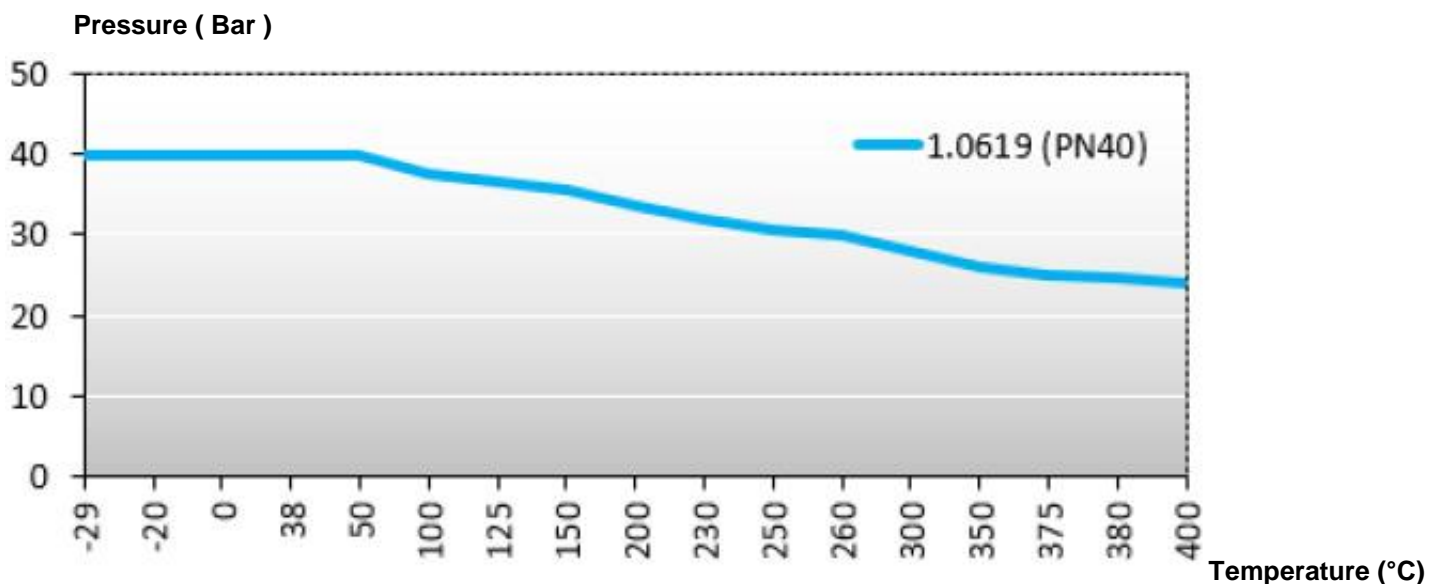

USE:

- No corrosive or no toxic fluids, steam, hydrocarbons, thermic fluid
- Min and max Temperature Ts : - 29°C to + 400°C
- Max Pressure Ps : 40 bars (see graph under)
- Δp 20 bars max for DN125, 15 bars max for DN150, 19 bars max for DN200
- Keep greased the stem

CARBON STEEL GLOBE VALVE WITH BELLOW PN40 ICP DIN 3202-1 F1**INSTALLATION INSTRUCTIONS****GENERAL GUIDELINES :**

- Ensure that the valves to be used are appropriate for the conditions of the installation (type of fluid, pressure and temperature).
- Be sure to have enough valves to be able to isolate the sections of piping as well as the appropriate equipment for maintenance and repair.
- Ensure that the valves to be installed are of correct strength to be able to support the capacity of their usage.
- **Installation of all circuits should ensure that their function can be automatically tested on a regular basis (at least two times a year).**

INSTALLATION INSTRUCTIONS :

- **Before installing the valves, clean and remove any objects from the pipes** (in particular bits of sealing and metal) which could obstruct and block the valves.
- **Ensure that both connecting pipes either side of the valve (upstream and downstream) are aligned (if they're not, the valves may not work correctly).**
- **Make sure that the two sections of the pipe (upstream and downstream) match, the valve unit will not absorb any gaps. Any distortions in the pipes may affect the tightness of the connection, the working of the valve and can even cause a rupture.** To be sure, place the kit in position to ensure the assembling will work.
- **If sections of piping do not have their final support in place, they should be temporarily fixed. This is to avoid unnecessary strain on the valve.**
- Tighten the bolts in cross.
- It's recommended to operate the valve (open and close) 1 to 2 times per year
- Tighten the gland packing at the first start of the installation (with a moderate torque) so that there's no leakage and the handwheel is easy to operate.
- Do not use tools to operate the handwheel
- Respect the flow direction indicated by the arrow
